

DRY CLEANING PROCESS EMPLOYING A UNITARY  
CHEMICAL DISPENSING CABINET

ABSTRACT

5 A cabinet is provided containing multiple chemical  
containment housings mounted on a base portion mounted on an  
interior panel. Each base portion has a nozzle press fitting  
into an opening to a flexible bag containing a dry cleaning  
chemical, the flexible bag mounted within the containment  
housing. In addition, the base portion has an opening  
connected to one end of a conduit, with the second end of the  
conduit connected to a chemical dispensing tube. The  
dispensing tube is mounted on a front exterior panel of the  
cabinet, and is held in place by a line under tension connected  
at one end to the dispensing tube and at its other end to a  
tension reel mounted within the interior of the cabinet.  
Squeezing of the dispensing tube while aimed at a garment stain  
causes the stain removing chemical to flow onto the garment.
